

Health and Safety Consultancy

Machinery Safety

The safety of machinery regulations places a duty on machinery designers, users and importers to ensure that machines are safe for use. This also includes machines that are made for your own use in your own plants. The Provision and Use of Work Equipment Regulations (PUWER) also requires machinery to be safe and includes a duty to inspect and test prior to use and on an ongoing basis to ensure that they are well maintained and continue to be safe.

IOH Chartered Safety Consultants have many years experience in machinery safety. This includes over ten years representing the UK on the development of European machinery safety standards, the introduction of robotic and safety software standards for use in the motor industry and the discussion on design and compliance for new equipment with overseas machinery manufacturers.

IOH can provide CE Marking services including assessments on the essential health and safety requirements, declarations of conformity or incorporation, PUWER risk assessments, practical cost effective guidance on the safety of machinery and advising machinery manufactures worldwide on UK machinery safety requirements.

Our consultants can also inspect and test equipment for compliance prior to you accepting it into your workplace thereby ensuring compliance with the provisions of PUWER. We can also train your staff to be self sufficient in these processes.

IOH believes in **Reasonable and practical health and safety** so that it will add value and not cost to your business.
